

Retail Analytics Database Diagram (Star Schema)

This diagram represents the logical data model used for the Sales Dashboard. The model follows a star schema with one fact table and supporting dimension tables.

FACT TABLE: transformed_online_retail

Column Name	Description
transaction_id	Unique transaction identifier
InvoiceNo	Invoice number (order identifier)
CustomerID	Foreign key to Customer dimension
StockCode	Foreign key to Product dimension
OrderDate	Order date
Quantity	Number of units sold
UnitPrice	Price per unit
Revenue	Quantity × UnitPrice
Country	Customer country
Year	Order year
Month	Order month

DIMENSION TABLE: customers_new

Column Name	Description
CustomerID (PK)	Unique customer identifier
Country	Customer country

DIMENSION TABLE: products_new

Column Name	Description
StockCode (PK)	Unique product identifier
Description	Product name/description

Relationships

From Table	To Table	Relationship
customers_new.CustomerID	transformed_online_retail.CustomerID	One-to-Many
products_new.StockCode	transformed_online_retail.StockCode	One-to-Many

This star schema enables efficient aggregation, filtering, and slicing of sales data across customers, products, and time dimensions.
